## Today's Lecture

- Spline models
- Penalized spline regression

[More info: Harrel, Regression Modeling Strategies, Chapter 2, PDF handout]

#### Piecewise linear models

A piecewise linear model (also called a change point model or broken stick model) contains a few linear components

- Outcome is linear over full domain, but with a different slope at different points
- Points where relationship changes are referred to as "change points" or "knots"
- Often there's one (or a few) potential change points

#### Piecewise linear models

Suppose we want to estimate E(y|x) = f(x) using a piecewise linear model.

For one knot we can write this as

$$\mathsf{E}(y|x) = \beta_0 + \beta_1 x + \beta_2 (x - \kappa)_+$$

where  $\kappa$  is the location of the change point and

$$(x-\kappa)_+=$$

# Interpretation of regression coefficients

$$\mathsf{E}(y|x) = \beta_0 + \beta_1 x + \beta_2 (x - \kappa)_+$$

$$\beta_0 =$$

$$lacksquare$$
  $\beta_1 =$ 

$$\beta_1 + \beta_2 =$$

#### **Estimation**

- Piecewise linear models are low-dimensional (no need for penalization)
- Parameters are estimated via OLS
- The design matrix is ...

#### Multiple knots

Suppose we want to estimate E(y|x) = f(x) using a piecewise linear model.

For multiple knots we can write this as

$$E(y|x) = \beta_0 + \beta_1 x + \sum_{k=1}^{K} \beta_{k+1} (x - \kappa_k)_+$$

where  $\{\kappa_k\}_{k=1}^K$  are the locations of the change points

- Note that knot locations are defined before estimating regression coefficients
- Also, regression coefficients are interpreted conditional on the knots.

```
library(MASS)
library(SemiPar)
## Error: there is no package called 'SemiPar'

## Error: object 'lm.lin' not found
```

```
summary(lm.lin)$coef
## Error: object 'lm.lin' not found
```

#### Piecewise quadratic and cubic models

Suppose we want to estimate E(y|x) = f(x) using a piecewise quadratic model.

• For multiple knots we can write this as

$$E(y|x) = \beta_0 + \beta_1 x + \beta_1 x^2 + \sum_{k=1}^{K} \beta_{k+2} (x - \kappa_k)_+^2$$

where  $\{\kappa_k\}_{k=1}^K$  are the locations of the change points

- Similar extension for cubics
- Piecewise quadratic models are smooth and have continuous first derivatives
- Often, knots taken as quintiles of the data.

## Advantages of piecewise models

Piecewise (linear, quadratic, etc) models have several advantages

- Easy construction of basis functions
- Flexible, and don't rely on determining an appropriate form for f(x) using standard functions
- Allow for significance testing on change point slopes
- Fairly direct interpretations

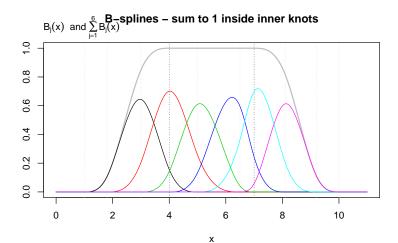

### B-splines and natural splines

#### Characteristics

- Both B-splines and natural splines similarly define a basis over the domain of x
- Can be constrained to have seasonal patterns
- They are made up of piecewise polynomials of a given degree, and have defined derivatives similarly to the piecewise defined functions
- Big advantage over linear splines: parameter estimation is often fairly robust to your choice of knots
- Big disadvantage over linear splines: harder to interpret specific coefficients

## B-splines basis functions

$$\mathsf{E}(y|x) = \beta_0 + \sum_{j=1}^6 \beta_j B_j(x)$$

```
require(splines)
lm.bs3 = lm(y ~ bs(range, df = 3))

## Error: object 'y' not found

plot(range, y, xlab = "Range", ylab = "log ratio", pch = 18)

## Error: object 'y' not found

points(range, lm.bs3$fitted.values, type = "l", col = "red", lwd = 2)

## Error: object 'lm.bs3' not found
```

```
lm.bs5 = lm(y ~ bs(range, df = 5))
## Error: object 'y' not found
plot(range, y, xlab = "Range", ylab = "log ratio", pch = 18)
## Error: object 'y' not found
points(range, lm.bs5$fitted.values, type = "l", col = "red", lwd = 2)
## Error: object 'lm.bs5' not found
```
